## ZERO WASTE

# A Step Towards Ensuring Food Security in the Future: Toxic-free Organic Farming in Betgari

The farming plot is being cultivated using compost only. The cultivator is happy to observe the growth of the crops. Therefore, the cultivator is willing to continue farming using compost in the long run. It's completely visible that the crops grown in the organic farming plot are healthier in comparison with the nearby crops that were grown using chemical fertilizer. Potato, Spinach, Brinjal, Cauliflower, Green Chili, Carrot, Onion, and Garlic were cultivated in this plot. Three varieties of potatoes were cultivated covering most of the plot area. After picking potatoes, a total of 340 kg of potatoes are available. Among these Desi Kukri 29 kg, Lal Bograi 22 kg, and Cardinal 289 kg. The nearby people of the farming plot are gradually being motivated for practicing organic farming. Those who taste the vegetables from this organic farm said that the taste is really very good and there is no bad smell in these vegetables which was found in those vegetables that are cultivated with chemical fertilizers.
